

# Working Memory Workshop

- Dr. Jayne Newbury, Kate Cook and Ruth Ramsay
- University of Canterbury
- Department of Communication Disorders

---

---

---

---

---

---

---

---

## Aims of workshop

For participants to:

- understand working memory systems relevant to language processing
- understand the implications of poor working memory for assessment /intervention
- have hands-on experience testing working memory
- understand the evidence base around working memory training programmes
- consider application to clients

---

---

---

---

---

---

---

---

A screenshot of the Cogmed website. At the top, it says 'PEARSON' and 'ALWAYS LEARNING'. Below that, there are navigation links for 'CONSUMERS', 'EDUCATORS', and 'HEALTH CARE PROFESSIONALS'. A search bar is on the right. The main menu includes 'Program', 'Users', 'Research', and 'Company'. The central banner features a photo of a smiling woman and child, with the text 'COGMED LEADS TO SUSTAINED IMPROVEMENTS IN WORKING MEMORY. FROM CHILDHOOD TO ADULTHOOD'. Below the banner is a yellow button that says 'DOWNLOAD OUR CLAIMS &amp; EVIDENCE'. At the bottom, there are six small icons with labels: 'About Working Memory', 'Cogmed in your area', 'F.A.Q.', 'How is Cogmed Different.', 'In School', and 'Sign up for a Free Webinar'.

---

---

---

- START NOW!
- Who it Helps
- How it Works
- What You Get

## Who It Helps

### Find Success with Jungle Memory

- Makes Learning Easier for 7 to 16 year olds**  
 Jungle Memory is scientifically proven to boost learning outcomes for students with learning difficulties, including Dyslexia and Autistic Spectrum Disorder.
- Proven to Work**  
 Evidence from clinical trials demonstrates that Jungle Memory improves IQ, working memory, and grades. Students who used Jungle Memory increased their IQ and their grades from a C to a B, and from a B to an A in just 8 weeks. [\[link\]](#)
- Based on cutting-edge Science**  
 Jungle Memory is based on cutting-edge science to train Working Memory. Working Memory is one of the most important learning skills. It is brain's engine of learning.

We conducted a randomized study on Lumosity, using crossword puzzles as an active control.

**What we did**

Our scientists had 4,725 participants complete the study. Half trained with Lumosity, while the rest did online crossword puzzles to control for placebo effects.

**What we found**

After 10 weeks, the Lumosity group improved more than the crosswords group on an aggregate assessment of cognition.

**Next questions**

These results are promising, but we need to do more research to determine the connection between improved assessment scores and everyday tasks in participants' lives. That's our next focus.

Cognitive training programmes are now multi-million dollar businesses

It is important for SLTs to understand what WM is and how it interfaces with language so we can:

- Inform your recommendations for working memory assessment / intervention
- Give advice to parents of children who have limited WM spans.

# Memory and Language

How do you learn language without a good memory?

Much research done on the interaction of memory systems and language processing  
Poor working memory is a current causal theory of SLI (Bishop, 2006)  
Poor working memory is commonly associated with specific learning disabilities e.g. dyslexia (Dawe, Leitao, Claessen & Nayton, 2015)

---

---

---

---

---

---

---

---

# Short term memory

- Up to 20 seconds (depending)
- Limited capacity – 4 chunks
- Storage, rehearsal and retrieval
- Decay – mitigated by rehearsal
- Measured by simple span tasks
- Examples – phone numbers, exact sentence someone said, how to spell a new word, how to say a new word

Baddeley (2000)

---

---

---

---

---

---

---

---

# Long term memory

- Unlimited capacity
- Gateway to LTM is STM
- Storage and retrieval
- Cue dependent – can access information given right cues
- Can be divided into two areas
  - Declarative e.g. vocabulary, faces
  - Procedural e.g. how to ride a bike, grammatical understanding of a sentence, keyboard skills, swimming

Baddeley (2000)

---

---

---

---

---

---

---

---

# Working memory

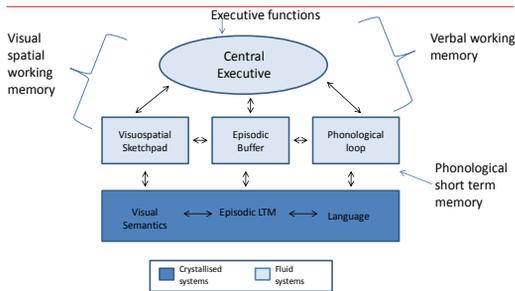

- Involves **processing** of information **stored** in long term and short term memory

NB. we use 'short term memory' for storage alone and 'working memory' for storage and processing.

- Closely linked to language processing are:
  - phonological short term memory
  - verbal working memory

Baddeley (2000)

## Baddeley's model of working memory (2000)

## Phonological short term memory

- Proposed to be a specialised memory system which sets up long term representations of phonological forms necessary for learning new vocabulary.
- Capacity of phonological loop
- Assessed through repeating increasingly long non-words e.g. "strimperdiction"
- Many studies have shown non-word repetition is an extremely sensitive test of past and current Language impairment (e.g. Bishop, North & Donlan, 1996)
- *Try out non-word repetition test*

## Research on PSTM and language

- WM span increases with development (Gathercole & Hitch, 1993)
- PSTM tends to be **poor** in children with SLI even relative to language matched peers (Gathercole and Baddeley, 1990).
- Higher PSTM associated with **higher vocabulary** and **syntax** in preschool years (Newbury et al., 2015 / in press; Chiat & Roy, 2008)
- PSTM associated with **better phonological awareness** and acquisition of decoding skills (Gillam & van Kleeck, 1996)
- Specific acquired PSTM deficits associated with difficulties learning **foreign vocabulary** and **comprehension** of complex syntax (Baddeley, Papagno & Vallar, 1988)

---

---

---

---

---

---

---

---

## Research on PSTM and language

- Strong evidence of PSTM involvement in learning **novel** phonological forms.
- The better you can recall a novel word form, the fewer repetitions of it you need before a strong representation is laid down in LTM and it has become part of your vocabulary.
- A **slow start to vocabulary** acquisition is common pattern seen in children with SLI.
- Children with resolved early vocabulary delays usually have a **shorter PSTM span** even once they have caught up with language (Bishop North, Donlan 1996).
- There is also some evidence to suggest PSTM is involved in the **acquisition of morpho-syntax** as well, a key deficit in SLI (Chiat and Roy, 2008).

---

---

---

---

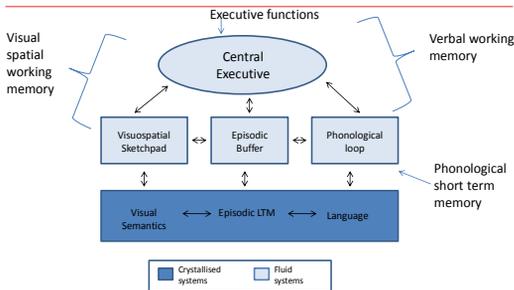

---

---

---

---

## Baddeley's model of working memory (2000)

---

---

---

---

---

---

---

---

## Verbal working memory

- Proposed to involve both **storage** and **processing** of verbal information
- Assessed in listening span task e.g. child hears “pumpkins are purple (true / false); balls are round (true / false)” and then recalls the last word in both statements (Alloway, 2012; Tompkins et al., 1994)
- Children with SLI have consistently **shorter listening spans** for sentences than TD children. Most have shorter spans than language matched younger TD children. (Archibald & Gathercole, 2006)
- *Try out the working memory measure*

---

---

---

---

---

---

---

---

---

---

## Verbal working memory

- VWM and language skills show a **strong association** in children with SLI and TD children.
- Evidence of VWM involvement in **sentence comprehension, inferences, metaphors, story generation, discourse skills**. The conscious processing of complex new language for the purposes of comprehension.
- Central executive is thought to be **weaker** in children with SLI.
- **Mixed evidence** of executive Function deficits in children with SLI – more common in those with a severe disorder.
- *VSWM shows some weaknesses in children with SLI due to involvement of the Central Executive but not the Visuospatial Sketchpad.*

---

---

---

---

---

---

---

---

---

---

## What impact could a low VWM span have on language ?

- Poorer comprehension of **complex grammar / discourse**
- **Fewer semantic links** between words
- Difficulty with **inferences**
- More **effortful processing** even of simple sentences e.g. SVO
- **Slower** academic learning
- More **difficulty correcting errors**
- More **difficulty processing multiple streams** of input

(Zaretsky, 2004; Montgomery & Evans, 2009; Baddeley, 2010)

---

---

---

---

---

---

---

---

---

---

## Can we separate WM and language for assessment purposes?

- If you are assessing verbal WM – by definition, **no**.
  - Can reduce semantic / syntactic processing demands so the linguistic demands are well within the ability of the child. The WM load increases as task progresses.
- If you are assessing PSTM – by definition, **no**.
  - You can reduce wordlikeness. Will always be a phonological task. Can keep the phonological demands within the ability of the child, so mainly the memory load increases as words get longer.
- Can more easily assess visual spatial working memory systems separately from language – but people may use language strategies

---

---

---

---

---

---

---

---

---

---

## Investigation: Can working memory and language scores stand alone?

- Archibald & Joanisse (2009) tested 400 school-aged children on WM / Language / IQ tests
- They identified 6 subgroups of children
  - Language impairment only
  - Working memory impairment only
  - Language and working memory impairment
  - WM impairment in either verbal or visual spatial
  - LI and WM impairment in either verbal or visual spatial
  - No language / WM impairments

---

---

---

---

---

---

---

---

---

---

## Implications from the study

- ▶ YES the subgroups tell us they dissociate
- ▶ It also casts doubt that poor WM is a **causal factor** in Language Impairment
- ▶ The correlations between WM and language are **strong** but are **not perfect**
  - ▶ Poor working memory alone is insufficient to cause a language impairment. Also it is not necessary as children can have a LI without a WM impairment. (Bishop, 2006)
- ▶ There must be **other factors** which affect language and working memory abilities
  - ▶ E.g. Processing speed, procedural memory, auditory processing

---

---

---

---

---

---

---

---

---

---

## Assessing Working Memory

- WM tests which SLTs with a bachelor’s level qualification can use:
  - CELF-4 (Semel, Wiig & Secord, 2006) subtests – Memory Composite includes span tasks
  - Automated Working Memory Assessment II (Alloway, 2012)
  - Working Memory Rating Scale (Alloway, Gathercole & Kirkwood, 2008)
  
- Postgraduate qualification:
  - Working Memory Test Battery for Children (Gathercole & Pickering, 2001)

---

---

---

---

---

---

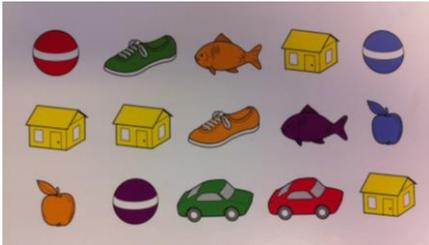

---

---

## Example from Concepts and Directions (CELF4)

- Point to the house in the top row

---

---

---

---

---

---

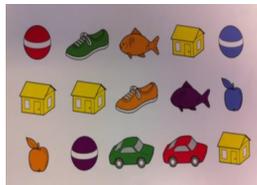

---

---

## Example from Concepts and Directions (CELF4)

- PSTM / VWM
- Linguistic system
  - Semantics
  - Syntax
- Visual spatial
- Episodic buffer
- Pointing
- *Relies more on verbal memory and linguistic understanding*

---

---

---

---

---

---

---

---

## Recalling sentences (CELF4)

- Repeat after me:
  - “The van was preceded by the ambulance”
  - No visual stimuli
  - No repetitions allowed
  - No processing per se required, just a repetition, however studies show that people do process the meaning automatically and if they can't recall the sequence of words perfectly, recreate a new sentence with similar meaning
  - PSTM and linguistic system
  - SR – measures primarily linguistic system

---

---

---

---

---

---

---

---

---

---

## Comments on sentence repetition

- Either delayed or immediate repetition
- Proposed as a clinical marker of SLI
- Klem et al., (2015) reported results of a longitudinal study looking at interrelationships between language, WM, and sentence repetition.
  - Concluded that SR is best seen as a measure of **underlying language ability** rather than memory
  - Useful for lang ax as it draws on a wide range of **language processing skills**

---

---

---

---

---

---

---

---

---

---

## Implications for assessment

- Consider the WM **demands** of the tasks given
- Sentence repetition taps both STM and core language skills in LTM
- Consider the **visual support** available in subtests as this reduces the load on WM
- Consider how **familiar the vocabulary** is, as this reduced the load on WM
- **However be cautious in simple interpretations**
- CELF-5 has WM subtest – refer for further cognitive testing if difficulties noted. Don't interpret it.

*Take home point:  
Don't try to separate WM and language entirely – they work together as an integrated system. However some students have a more marked difficulty with one or the other.*

---

---

---

---

---

---

---

---

---

---

### Case 1 -

- WD age 8 years 1 month (male)
- TONI score 109

Memory Tests	Non-Word Repetition	Listening Span
Standard scores	80	76

Language Test	Core Language Scale	Concepts and Directions	Word Structure	Recalling Sentences	Formulated Sentences
Standard score	81	10	4	7	6

Standard scores have a mean of 100 (10) and standard deviation of 15 (1.5)

---

---

---

---

---

---

---

---

---

---

### Case 2 -

- HB 8 years old, female
- TONI score 87

Memory Tests	Non-Word Repetition	Listening Span
Standard scores	92	101

Language Test	Core Language Scale	Concepts and Directions	Word Structure	Recalling Sentences	Formulated Sentences
Standard score	69	4	5	4	6

---

---

---

---

---

---

---

---

---

---

### Investigation: What do mild LI / mild – mod WM difficulties look like in class?

- Archibald, Joanisse & Edmunds (2011)
  - Children with SLI / SWMI / both presented similarly in class
  - Teachers perceived their behaviour mainly as difficulties with **attention, language and behaviour**
  - Children with WM difficulty were reported to have **difficulty with language** (e.g. needing more explanations) children with language difficulties were reported to **have difficulty with memory**
  - Having difficulties in both did not double their problems in class – mainly presented as an LI

---

---

---

---

---

---

---

---

---

---

## Commonly reported behaviours of children with WM / LI

- ▶ inattention
- ▶ failure to monitor the quality of work
- ▶ lack of creativity in problem solving
- ▶ speaking over others
- ▶ needing instructions repeated
- ▶ incorrect / inadequate answer to question
- ▶ careless mistakes
- ▶ does not wait for turn
- ▶ miscommunications...

---

---

---

---

---

---

---

---

---

---

## Application to your caseload

- Consider a child on your caseload whom you know/ suspect has working memory difficulties:
  - What assessments have been done to confirm this?
  - Would confirmation of WM or other cognitive difficulties through assessment by yourself or a psychologist be helpful?
  - What intervention supports can be / have been offered to this child to either compensate or improve his/her WM limitations?

---

---

---

---

---

---

---

---

---

---

## Implications for WM intervention

- Children often asked to store a **considerable amount of information** and then **act on it** in class
- **Task performance** = capacity limits, knowledge representation and strategy use
- How are tasks **communicated**, how is information delivered?
- What **increases** WM demands? – new concepts, new vocabulary, less visual support, complex sentences, limited time to process

---

---

---

---

---

---

---

---

---

---

## Implications for WM intervention

Cont.

Example tasks:

Following instructions; writing tasks especially when new for the student; paragraph comprehension; reading comprehension; mental calculations for math e.g. word problems.

*General rule of thumb – one new thing at a time.*

- *If vocab is new, keep syntax simple.*
- *If concepts are new, use familiar vocabulary to explain it.*
- *Complex sentences have the best chance of being understood once the vocabulary and concepts are familiar.*

---

---

---

---

---

---

---

---

---

---

## WM Intervention options

- Reduce the impairment
  - Working memory training (commercial programmes)
  - Language intervention which incorporates increasing demands on working memory in the task
- Compensation
  - Strategy use to reduce the impact of the working memory difficulty
  - Information given to child / family / teachers

---

---

---

---

---

---

---

---

---

---

## Key WM compensatory strategies – *students' role*

- Improve **metacognition** and use of **strategies**
  - Teach children to reflect on the task and what they can do to help themselves
  - Suitable for older children e.g. 9+
  - Students with LLD less likely to use strategies than TD children even when taught
- Examples
  - Rehearsal strategies – chunk, repeat
  - Task analysis - steps needed
  - Visualise –following instructions, or overloading for some
  - Study / organisation skills – make a study plan

---

---

---

---

---

---

---

---

---

---

### Key WM compensatory strategies – teacher or whānau role

- **Repetition**
- **Chunking** – pause and summarise
- Biggest hurdle is **starting** the task
- Ask student to **repeat** to you what you said
- **Slow** down rate of speech
- Do **one part** of task then come back

---

---

---

---

---

---

---

---

---

---

### Key WM compensatory strategies teacher or whānau role

- In **group** discussions, ask child with poor WM to contribute **1st** rather than 3<sup>rd</sup> or 4<sup>th</sup>
- Present information **visually**
  - Graphs, charts, schedules, written instructions, diagrams,
- **Pre-teach** information
- Increase **automaticity** of skills

---

---

---

---

---

---

---

---

---

---

### Working memory training

- Recent surge in working memory / cognitive training programmes available commercially online e.g. CogMed/ Jungle Memory / Lumosity
- concept of neuroplasticity
- Part of the search to remediate cognitive disorders
- Huge public interest and appeal
- Multi-million dollar industry

---

---

---

---

---

---

---

---

---

---

### Luminosity quick look

---

---

---

---

---

---

---

---

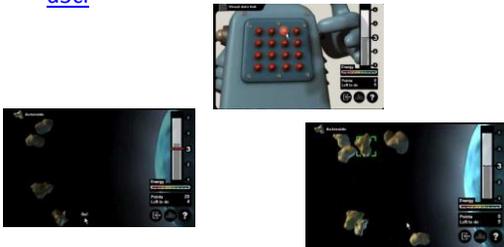

---

---

### A closer look at CogMed

- <https://www.youtube.com/watch?v=vUYWF1xd3cl>

---

---

---

---

---

---

---

---

---

---

### Excerpt of research summary from CogMed website:

- States the following claims are supported by evidence:
  - **CM results in sustained improvements (2-12 mo) in WM from children – adults (30 studies)**
    - NB most outcome measures similar to training tasks
    - NB improvements in visual more common than verbal memory
  - **Learning outcomes in reading / math for some but not all students**
    - NB WM only one factor in academic success; might be cumulated benefits over time
- Acknowledges that WM is easy to measure in laboratory situations but not in everyday life – this limits the research base

Soderqvist & Nutley (2016)

---

---

---

---

---

---

---

---

---

---

## Holmes et al. (2015)

- The only study published so far on WM training with children with LI
- Used Cogmed
- Compared 8-11 yr old TD children (n=15) / children with LI (n=12)
- Both groups showed minimal gains in verbal memory except better NWR at 5 syllable level in LI group
- Both groups showed significant gains in VSSTM
- Those with lower verbal IQ initially made more gains in verbal memory and VSSTM
- Concluded that WM training may be useful for some children with LI

---

---

---

---

---

---

---

---

---

---

## Independent systematic / meta-analysis reviews

- None of these reviews below found the evidence presented by Cogmed to be convincing e.g.
  - The effect size confidence intervals accumulated across the highest level studies crossed zero
  - They queried the value of training the test
  - Subjective bias in teacher / parent questionnaires
- They concluded the evidence so far is unconvincing that Cogmed improves WM or attention or that it transfers to academic outcomes.
- WM training is a work in progress
  - Hulme & Melby-Lervag (2012)
  - Shipsted, Randall and Engle (2012)
  - Redick et al. (2015)

---

---

---

---

---

---

---

---

---

---

## Our thoughts on CogMed

- Cost around \$1500 for 5 week training
- Can be done alongside mainstream schooling
- Training tasks are not very similar to functional everyday activities
- Likely to result in child getting better at tasks trained
- May have a positive psychological effect e.g. child believes they can learn, attend better, succeed?
- Money probably better invested in individual tutoring in reading / maths / language i.e. functional practice at meaningful tasks at the child's level
- Fundamentally this is a parent decision

---

---

---

---

---

---

---

---

---

---

## Summary/Recap

- Revision of working memory
- WM and language work together as an integrated system.
- Revision of what language assessments tell us about working memory
- Compensatory and intervention ideas discussed for working memory
  - A language intervention approach will target WM and language
  - A working memory approach targets the tasks worked on
